- Appendix B: Put the Fishway type into the first column. That way someone looking to construct specific fishway types can see if it is compatible with species present.
- Appendix C: For Passage facilities column, would it be possible to put the types in separate columns within and mark with an X whether it is species/lifestage appropriate for the fish in the first column? A quick look would see what types are pertinent without reading through the paragraph. Any caveats could be addressed in the column.
- It would be nice to have the visual of the type along with the description rather than have to flip through pages, but not sure if the page size will allow.
- Could pool and chute type have a photo showing the baffles? Looking at the current photo doesn't fit with the description of pool and weir.
- Criteria for adult lamprey should state no corners, or if corners present, rounded corners. If they can attach to the surface they have a better chance, some rounded edges are doable.
- Appendix A – (Habitat Connectivity Criteria) Why are the twp habitat connectivity not scored the same? For example, wouldn't the "0" column be "2/3 or more downstream" for both so both only go up to a rating of "3" instead of the adult connectivity critetria going up to "4"?
